A block in a string is a run of adjacent chars that are the same. Given a string, return the first substring that is with the lenght of the largest "block" in the string.

Input

Read from the standard input:

- string to search in -> `hoopla`

Output

Print to the standard output:

- One line of output - the first block with maximum lenght in the given array -> `oo`
- please **note** that different case matters.

Sample Tests

Input

hoopa

Copy

Output
